## SIEMENS

Quad Driver Incl. Short-Circuit Signaling
FZL 4146

## Bipolar IC

## Features

- Short-circuit signaling
- Four driver circuits for driving power transistors
- Turn-ON threshold setting from 1.5 to 7 V

| Type | Ordering Code | Package |
| :--- | :--- | :--- |
| FZL 4146 G | Q67000-H8743 | P-DSO-20-7 (SMD) |

## General Description

The IC comprises four driver circuits capable of driving power transistors (PNP or PMOS). The output transistors are protected against short-circuit to ground and supply voltage. The turn-ON threshold can be set from 1.5 V to 7 V . Overload at one or several outputs will be indicated at pin SQ (signaling output). The corresponding power transistors are then protected by changeover to clock-governed operation.

## Circuit Description

Each driver circuit has one active high driver input DI and a common enable input ENA (active high) is provided for all stages. The Q output is designed to drive the output transistors. The load current is sampled and, if necessary, limited via pin W. If the load current exceeds the preset value, the output stage switches off. Switching-ON again is provided by the built-in clock generator T. Its operation requires an external capacitor $C_{\mathrm{e}}$ at pin CE. If $C_{\mathrm{e}}$ is bridged by a break-key, switching-ON can only be carried out by operating this key. The duty cycle of the clock generator is $1: 47$ (e.g. $45 \mu \mathrm{~s} / 2.1 \mathrm{~ms}$ with $C_{\mathrm{e}}=10 \mathrm{nF}$ ). The clock generator is privileged versus the current sensor shut down. When the supply is connected, the internal RS-FF goes into the state corresponding to the released output.

The turn-ON threshold at input DI and ENA can be set via pin TS from 1.5 to 7 V .
$V_{\text {TS }}=0 \mathrm{~V} \ldots 1.5 \mathrm{~V} \quad$ Turn- ON threshold $=1.5 \mathrm{~V}$
$V_{\text {TS }}=1.5 \mathrm{~V} \ldots 7 \mathrm{~V} \quad$ Turn-ON threshold $=V_{\text {TS }}$
$V_{\text {TS }}=V_{\mathrm{S}} \quad$ Turn-ON threshold $=7 \mathrm{~V}$
Inputs DI, ENA and W are proof against line break, i.e. an open input at DI or ENA corresponds to input $L$, open input $W$ corresponds to overcurrent. If input TS is open, the highest turn-ON threshold is provided.
The internal current supply B and the undervoltage monitor UV ensure that in case of a supply voltage that is below the $V_{\mathrm{S}}$ turn-OFF threshold, outputs Q and SQ are disabled and the inputs go high-impedance. Basic functioning is possible within the range from $V_{\mathrm{s}}$ turn-OFF threshold to 4.5 V .
In case of overcurrent or short-circuit to ground at any output stage the signaling output (SQ) will go low. In clock-governed operation (i.e. when there is automatic switching-ON by the clock and not by a key), SQ goes high and low at the clock rate as long as a shortcircuit or overload is present. SQ is an open-collector output.
Any input and output is ESD proof within the limit values.

Notes: ${ }^{1)}$ An adequate resistor in the GND line can provide protection in case of wrong polarization of $V_{\mathrm{s}}$. It should be noted, however, that in this case all pins may become conductive across GND.
${ }^{2)}$ Loading may lead to degradation and thus to a shift of the switching threshold at W .
(Characteristics: switching threshold at W).
Short loading may lead to a deviation of approx. 20 mV .
${ }^{3)}$ In case of short-circuit of $V_{\mathrm{S}}$, the capacitance stored in $C_{\mathrm{e}}$ during previous operation will not damage the IC.
${ }^{4)}$ Note the power loss.

Notes: ${ }^{5}$ Loading may lead to degradation and thus to a shift of the switching threshold at W. Unfrequent loading leads to a deviation of approx. 20 mV .
${ }^{6)}$ Related to GND; the GND pins are connected with the chip carrier via the leadframe.
${ }^{7}$ ) If it can be prooved with samples.
${ }^{8)}$ During normal operation, the failure rate is $\leq 100$ fit acc. to SN 29500 at a junction temperature of $75^{\circ} \mathrm{C}$.

## Operating Range

| Parameter | Symbol | Limit Values |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | min. | max. |  |  |
| Supply voltage ${ }^{11}$ ) | $V_{\text {S }}$ | 4.5 | 40 | V | $V_{\text {TS }}=0 \ldots 1.5 \mathrm{~V}$ |
| Supply voltage ${ }^{12)}$ | $V_{\text {S }}$ | $V_{\text {TS }}+3$ | 40 | V | $V_{\text {TS }}=1.5 \ldots .7 \mathrm{~V}$ |
| Supply voltage ${ }^{13}$ | $V_{\text {S }}$ | 10 | 40 | V | $V_{\text {TS }}=V_{\mathrm{S}}$ |
| Supply voltage rise | $\mathrm{d} V_{s} / \mathrm{d} t$ | -1 | 1 | V/us |  |
| Junction temperature | $T_{\mathrm{j}}$ | -25 | 150 | ${ }^{\circ} \mathrm{C}$ |  |
| Time-determining capacitor of the clock generator | $C_{\text {e }}$ | 1 | 100 | nF | 10) |
| Input voltage | $V_{\text {Dl, ena }, \text { Ts }}$ | -2 | 40 | V | 14) 15) 16) 17) 19) |
| Current at output SQ | $I_{\text {SQ }}$ | -1 | 6 | mA |  |

Notes: ${ }^{9)}$ W pins that remain open, must be connected to $V_{\mathrm{S}}$.
${ }^{10)}$ The $C_{\mathrm{e}}$ value depends on the desired pulse width $t_{\mathrm{p}}$ during short circuit.
It applies: $C_{\mathrm{e}}=0.25 \mathrm{mS} \times t_{\mathrm{p}}$.
${ }^{11)}$ At an input threshold $=1.5 \mathrm{~V}$
12) At an input threshold $=1.5 \mathrm{~V}$ to 7 V
${ }^{13)}$ At an input threshold $=7 \mathrm{~V}$
${ }^{14)}$ This function is also ensured for $40 \mathrm{~V} \leq V_{\mathrm{S}} \leq 45 \mathrm{~V}$ and $-40^{\circ} \mathrm{C} \leq T_{\mathrm{j}} \leq-25^{\circ} \mathrm{C}$ as long as $0 \mathrm{~V} \leq V_{\mathrm{DI}, \mathrm{ENA}, \mathrm{TS}} \leq 40 \mathrm{~V}$.
15) The outputs $Q$ are disabled even if $-3 \mathrm{~V} \leq V_{\mathrm{DI}, \mathrm{ENA}} \leq-2 \mathrm{~V}$ or $-1 \mathrm{~mA} \leq I_{\mathrm{DI}, \mathrm{ENA}} \leq 50 \mu \mathrm{~A}$ and $V_{\mathrm{S}}-5 \mathrm{~V} \leq V_{\mathrm{w}} \leq V_{\mathrm{S}}+5 \mathrm{~V}$, max. 45 V .
${ }^{16)}$ The outputs Q are enabled even if $40 \mathrm{~V} \leq V_{\mathrm{D}, \text { ENA }} \leq 45 \mathrm{~V}$ and $V_{\mathrm{S}}-0.2 \mathrm{~V} \leq V_{\mathrm{W}} \leq V_{\mathrm{S}}+5 \mathrm{~V}$, max. 45 V .
${ }^{17)}$ Current limiting and disabling of outputs Q are ensured even if $40 \mathrm{~V} \leq V_{\mathrm{DI}, \mathrm{ENA}} \leq 45 \mathrm{~V}$ and $V_{\mathrm{s}}-5 \mathrm{~V} \leq V_{\mathrm{w}} \leq V_{\mathrm{s}}-0.4 \mathrm{~V}$.
${ }^{18)}$ Dynamic charge reversal of a 2-nF capacitor as in figure 1 is permissible (corresponds to short circuit to conducting output in P-channel MOSFET)
${ }^{19)}$ Proper working of the IC is also ensured if, before $V_{S}$ is turned-On, an input voltage $V_{\mathrm{DI}, \mathrm{ENA}}$ is present in the permissible range (footnote 15).
${ }^{20)}$ At $10 \mathrm{~V} / \mu \mathrm{s}$ short-term malfunction is possible, but never a latch-up.

## Characteristics

## Footnotes for the Characteristics

${ }^{1)}$ The given limit values apply to inputs DI, ENA, if they are not measured, from 0 to 40 V .
${ }^{2)}$ The layout provides an adaption of $V_{\text {wtyp. }}$ from $V_{\mathrm{S}}-0.3 \mathrm{~V}$ to $V_{\mathrm{S}}-0.4 \mathrm{~V}$ or $V_{\mathrm{S}}-0.48 \mathrm{~V}$ by simply changing of the ALU mask.
${ }^{3)}$ All inputs D11 to DI4 and W1 to W4 as well as Q1 to Q4
$I_{\text {SoN }}$ means the sum of all currents flowing from the voltage source $V_{\mathrm{S}}$ into the IC, i.e.
$I_{\mathrm{SON}}=I_{\mathrm{S}}+\sum I_{\mathrm{DI}}+\sum I_{\mathrm{ENA}}+\sum I_{\mathrm{W}}+\sum I_{\mathrm{Q}}$.
${ }^{4)}$ All other pins are open.
${ }^{5}$ ) The delay time of loop $\mathrm{W} \rightarrow$ I regulator $\rightarrow$ RS-FF $\rightarrow$ AND $\rightarrow$ current source $\rightarrow \mathrm{Q}$ is unaccessable for measurement without external wiring due to fast reaction of the current regulator. For this reason, in case of overload, the above mentioned switch-OFF delay time is replaced by the delay time for input $\mathrm{W} \rightarrow$ output SQ.
Measurement: jump function at W from $V_{\mathrm{W}}=V_{\mathrm{s}}$ to $V_{\mathrm{w}}=V_{\mathrm{S}}-1 \mathrm{~V}$
${ }^{6)} I_{\mathrm{Q}}=$ leakage current $I_{\text {Сво }}$ of the external PNP-driver transistor
${ }^{7)}$ For $V_{\mathrm{DI}, \mathrm{TS}}<1.5 \mathrm{~V}, I_{\mathrm{DI}, \mathrm{ENA}}$ remains below its minimum value; it is however ensured that in case of open inputs the corresponding outputs will be safely disabled.
